

# Assignment – 1

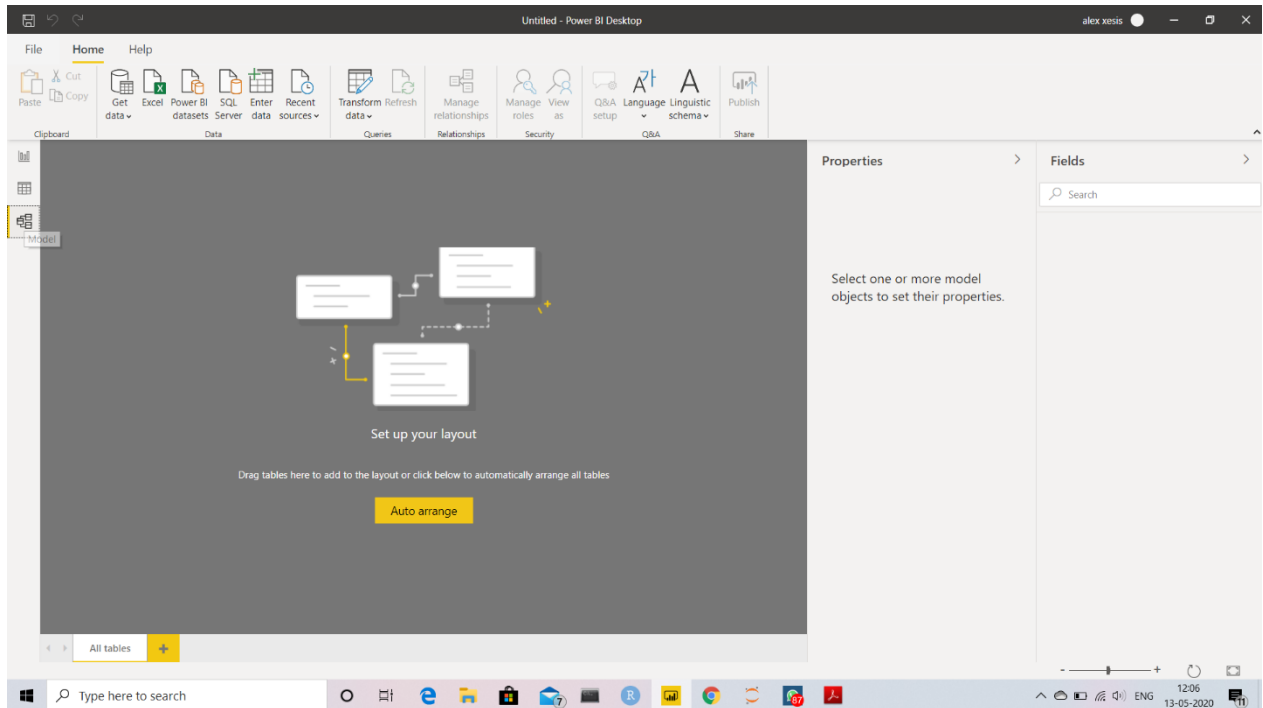

- Prepare a document and with the following screenshot

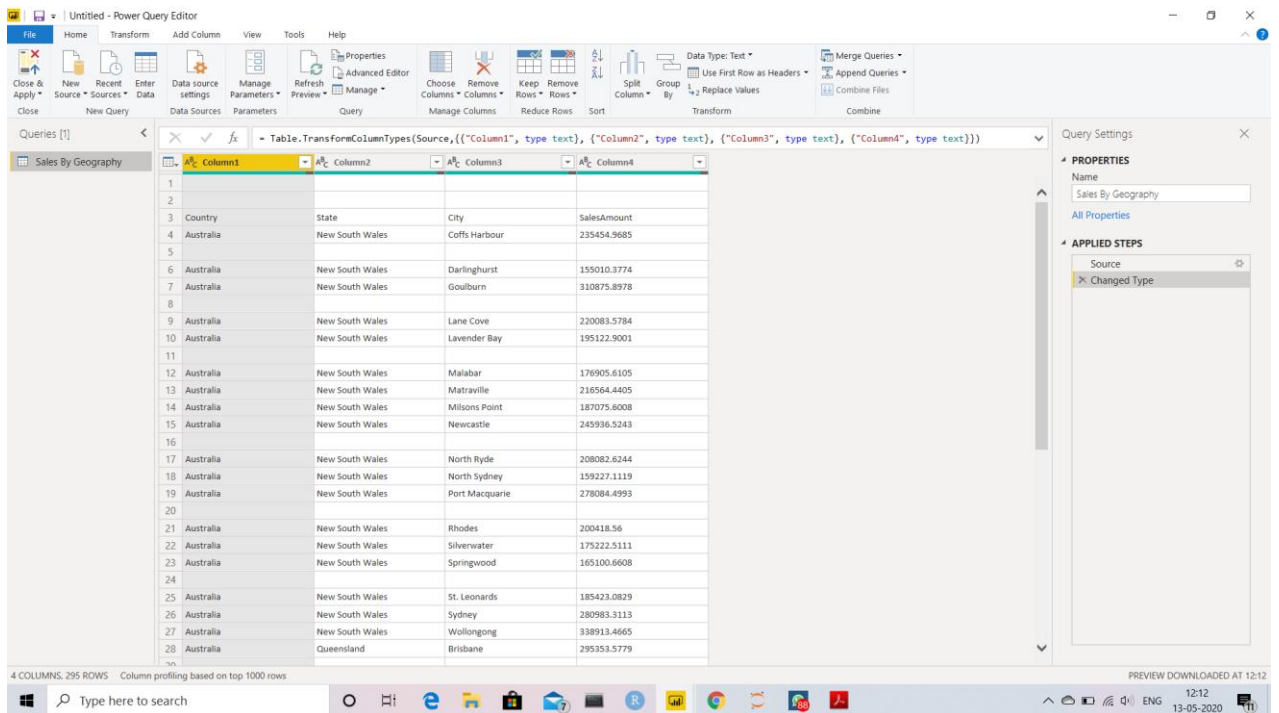

## Report View

## Data View

## Model View

## Power Query Editor

Power Query Editor interface showing the Advanced Editor window for a query named "Sales By Geography".

The Advanced Editor window displays the following M code:

```
let
    Source = Csv.Document(File.Contents("F:\MS Power BI and Tableau\sales data\Sales By Geography.csv"),[Delimiter=";", Columns=6, Encoding=65001]),
    #"Changed Type" = Table.TransformColumnTypes(Source,{{"Column1", type text}, {"Column2", type text}, {"Column3", type text}, {"Column4", type text}, {"Column5", type text}, {"Column6", type text}}),
in
    #"Changed Type"
```

The status bar indicates: No syntax errors have been detected.

The Query Settings pane on the right shows the query name "Sales By Geography" and the applied steps: Source, Changed Type.

The background shows a preview of the data table with columns: Country, State, City, Sales, and Profit. The data is filtered to show only rows where the Country is Australia.

Country	State	City	Sales	Profit
Australia	New South Wales	Wollongong	338913.4665	
Australia	Queensland	Brisbane	295353.5779
